

API METHODOLOGY

How the Jackpot Score is calculated

Every keyword the API returns carries a **Jackpot Score** (0–100) plus real market data. It isn't a guess or a single raw metric resold — it's a composite signal built from four independent data sources, so you can rank opportunities by how *winnable* they actually are.

- 1 AI seed generation.** From your product description and/or URL, the pipeline extracts grounded product context and generates seed keywords spanning buyer intents (direct, use-case, competitor) — not generic synonyms.
- 2 Multi-platform autocomplete expansion.** Seeds are expanded against real search-autocomplete suggestions, capturing the long-tail phrasing people actually type — including questions and modifiers.
- 3 Google Keyword Planner enrichment.** Every candidate is enriched with real monthly search volume, low/high CPC, and competition level — the same source advertisers price against.
- 4 Google Trends overlay.** Each keyword gets a trend direction (rising / stable / declining) so you can favor momentum over saturation.

The Jackpot Score

A composite of demand (volume), commercial value (CPC), the competition gap, trend momentum, and relevance to your product. Higher = a better opportunity to win. Sort descending and the strongest plays surface first — especially **low-competition, high-intent, rising** terms.

What each result field means

Field	Meaning
keyword	The search term.
monthlyVolume	Estimated monthly searches (Keyword Planner).
lowCpc / highCpc	Advertiser cost-per-click range (USD) — a proxy for commercial value.
competition	LOW / MEDIUM / HIGH paid competition.
jackpotScore	0–100 composite opportunity score.
intent	commercial / transactional / navigational — buyer readiness.
category	direct / use_case / competitor_brand — relation to your product.
trendDirection	rising / stable / declining (Google Trends).
